

# **Using Geographic Information Systems (GIS) to Identify Challenges in Access to Dental Care**

**National Oral Health Conference  
April 24, 2013**

Angie Sechler  
Minnesota Office of Rural Health & Primary Care  
Minnesota Department of Health

# Today's Presentation

## Part I

Provides an overview of activities for defining and mapping dental deserts using GIS at Minnesota Department of Health

## Part II

Discusses technical issues involving the use of GIS for dental workforce mapping

# Objectives – Part I

- To understand inequality and spatial distribution of oral health workforce using GIS mapping
- To draw attention to how GIS tools inform development and implementation of policies to address the needs of underserved populations
- To share lessons learned in Minnesota

# Oral Health Program

- Funded through CDC Cooperative Agreement and Health Resources & Services Administration (HRSA)
- Infrastructure and capacity building and oral health workforce development
- Focuses on essential public health functions as related to assessment, policy development and assurance

# Minnesota's First Oral Health Plan

Oral Health Program

## Minnesota Oral Health Plan

*Advancing Optimal Oral Health for All Minnesotans*

Executive Summary  
2013 – 2018

January 2013

# Minnesota's Underserved Populations:

- 55 percent of 3<sup>rd</sup> graders experienced dental decay (2010)
- 59 percent of children with Medicaid did not receive any dental services by or under the supervision of a dentist during Federal Fiscal Year 2011.
- Minnesota's poorest adults (<\$15K) were three times less likely than the most affluent (\$50K+) to visit a dentist in the past year (2010).

# Minnesota's Dental Workforce:

- 47 percent of dentists were 55 years or older (2009-2010).
- 26 percent of Minnesota dentists were practicing in a rural area (2010).
- 53 percent of practicing dentists submitted at least one dental claim for patients on public programs (2010).

# Office of Rural Health & Primary Care Workforce Analysis Program

- Quantifies Minnesota's health care workforce → Supply
- Identifies current resource and service gaps → Access
- Informs stakeholders of emerging health care workforce issues → Education
- Informs policy decisions that address adequate distribution of health care professionals for the future → Policy

# Health Care Workforce Data

In coordination with Minnesota's licensing boards, practice data on the following professions is regularly collected, analyzed and reported:

---

Physicians

---

Physician Assistants

---

Physical Therapists & Physical Therapy Assistants

---

Marriage & Family Therapists

---

Respiratory Therapists

---

Social Workers

---

Pharmacists

---

Behavioral Health Therapists

# Including the Dental Health Workforce

Dentists

Dental  
Assistants

Dental  
Hygienists

Dental  
Therapists

Advanced  
Dental  
Therapists\*

“Almost one third of the population reports some difficulty in accessing dental care.”

- Caswell Evans, Jr., Associate

Dean of Prevention and Public Health Sciences at the  
University of Illinois at Chicago College of Dentistry

# Minnesota's Rural Dental Shortage Areas

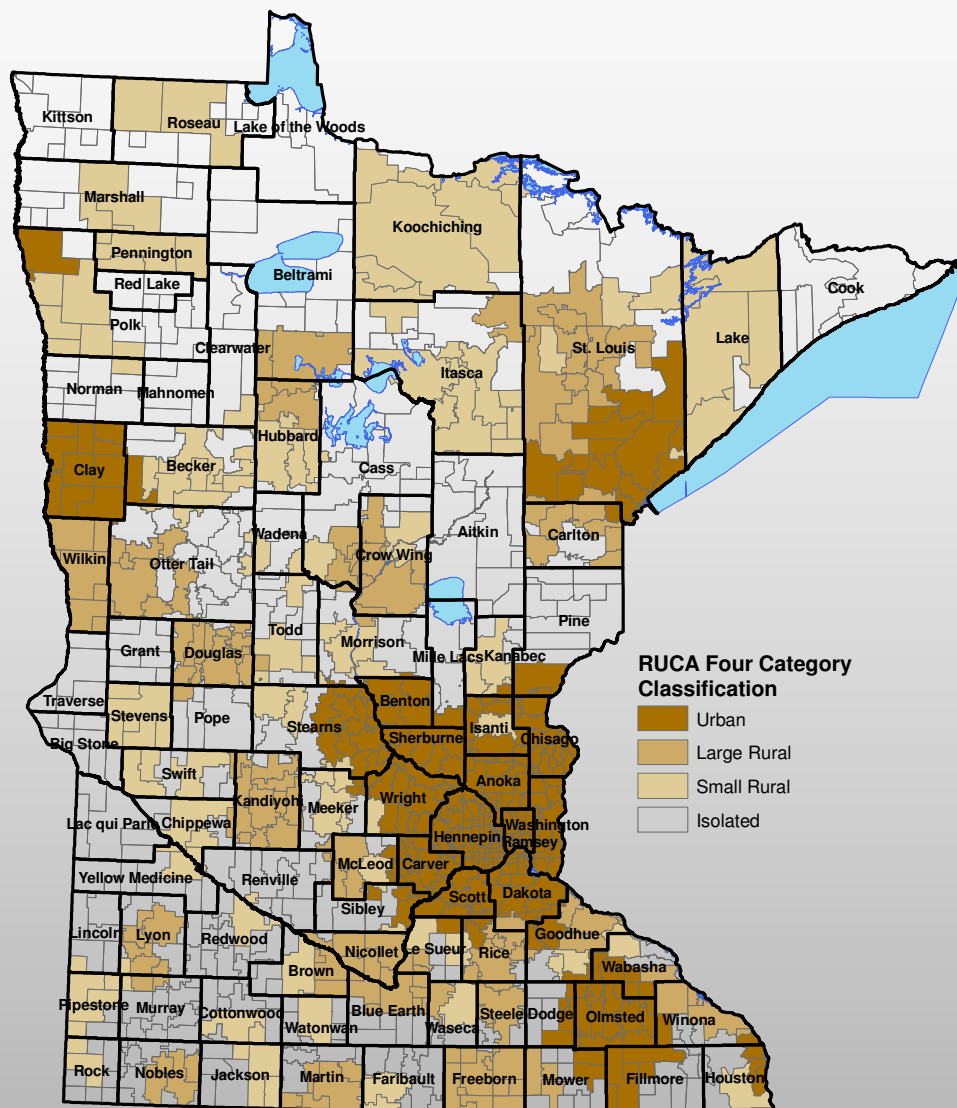

Based on  
 population-  
 to-clinician  
 ratio of  
 5,000:1

# Rural – Urban Commuting Areas (RUCAs)

The RUCA categories are a Census tract-based classification scheme to identify urban cores and adjacent territory economically integrated with those cores.

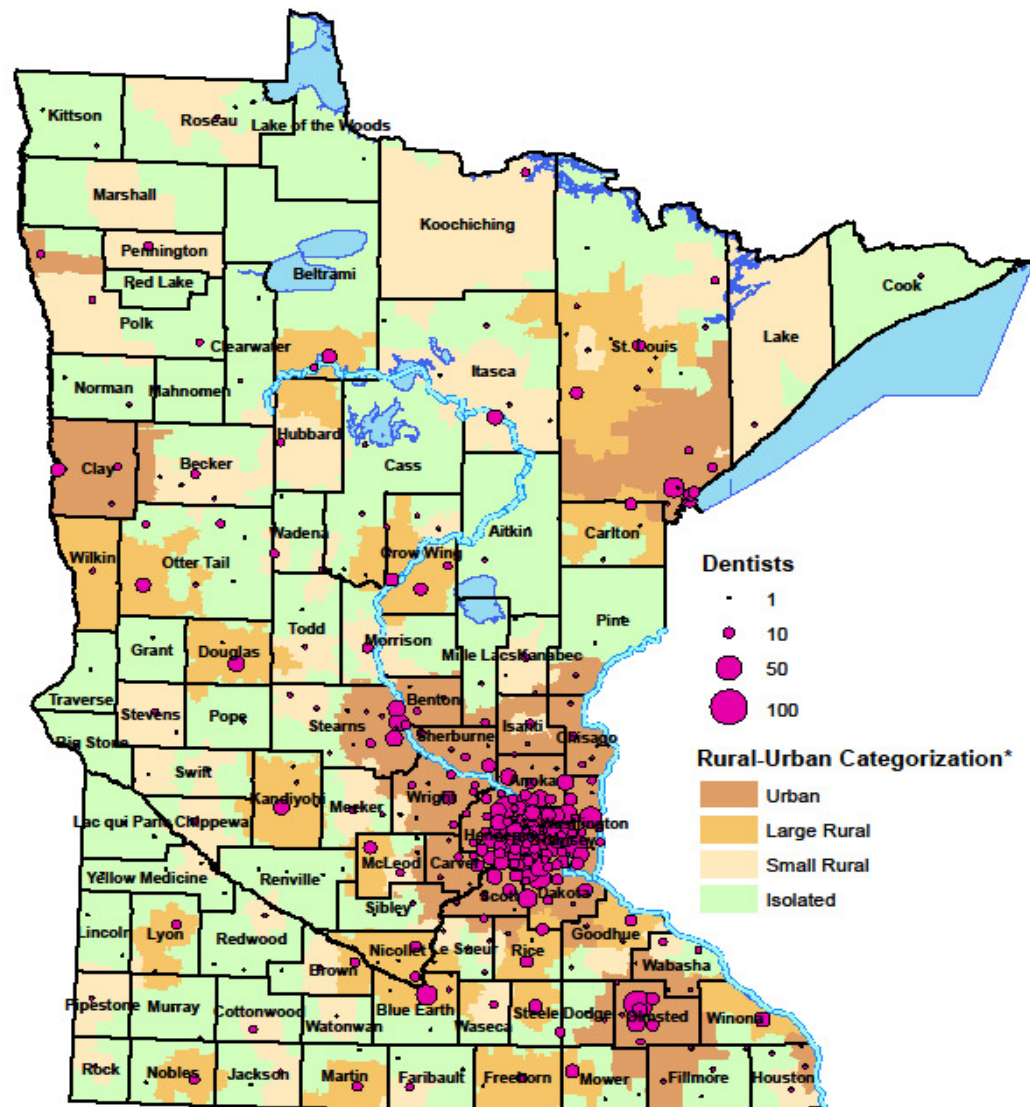

Rural-Urban Commuting Areas Zip Code  
 Approximation - Minnesota

# Inequitable Access?

- Maldistribution of existing dental workforce
- Geographic barriers (10,000 lakes)
- Rural = Low population density

Minnesota Licensed Dentists by Zip Code - 2011

\*Urban-Rural categorization is based on zip code RUCA (Rural-Urban Commuting Area) approximation.

# The Kansas Initiative

## Dental Clinics:

 within 10  
minute drive

 within 20  
minute drive

## Dental Clinics:

 within 10  
minute drive

 within 20  
minute drive

 within 30  
minute drive

## Drive Time & Poverty

30 minute drive time contours with a map showing population in poverty.

Some areas in northern Minnesota have both high concentrations of people living in poverty in addition to being 30 minutes or more from dental services.

# So What?

**Access requires more than just being within a 30 minute driving distance.**

- Aging dentist workforce → median age is 54 years;
- Unwillingness to practice in rural or underserved communities;
- Dental services continue to be under used by children of low-income families;
- Lack of collaborative practice among dental professionals
- Upsurge in people eligible for dental services after full implementation of ACA in 2014;

## Next Steps:

- Minnesota's Oral Health Plan
- Continue using GIS spatial analysis for refining Minnesota's "dental dessert" designation by including additional variables into the maps

## Lessons Learned:

- Finding a useable statewide road network dataset
- Find a better source of clinic information
- Incorporation of other data (i.e. insurance acceptance)

# Thank You
