10 Great Public Health Achievements of the 20th Century

1. Vaccines
2. Motor vehicle safety
3. Safer workplaces
4. Control of infectious diseases
5. Decline in deaths for coronary heart disease and stroke
6. Safer and healthier foods
7. Healthier mothers and babies
8. Family planning
9. Fluoridation of drinking water
10. Recognition of tobacco use as a health hazard

A Fluoride Story

The screenshot shows a journal article from The Lancet Neurology, Volume 13, Issue 3, March 2014. The article title is "Neurobehavioural effects of developmental toxicity". The authors listed are Dr Philippe Grandjean MD and Philip J Landigan MD. The text discusses neurodevelopmental disabilities and the role of industrial chemicals in causing them, specifically mentioning lead, methylmercury, polychlorinated biphenyls, arsenic, and toluene, and later adding fluoride, chlorpyrifos, dichlorodiphenyltrichloroethane, tetrachloroethylene, and polybrominated diphenyl ethers. It emphasizes the need for global prevention strategies.

Neurobehavioural effects of developmental toxicity

Dr [Philippe Grandjean](#) MD  , Philip J Landigan MD 

Summary

Neurodevelopmental disabilities, including autism, attention-deficit hyperactivity disorder, dyslexia, and other cognitive impairments, affect millions of children worldwide, and some diagnoses seem to be increasing in frequency. Industrial chemicals that injure the developing brain are among the known causes for this rise in prevalence. In 2006, we did a systematic review and identified five industrial chemicals as developmental neurotoxicants: lead, methylmercury, polychlorinated biphenyls, arsenic, and toluene. Since 2006, epidemiological studies have documented six additional developmental neurotoxicants—manganese, fluoride, chlorpyrifos, dichlorodiphenyltrichloroethane, tetrachloroethylene, and the polybrominated diphenyl ethers. We postulate that even more neurotoxicants remain undiscovered. To control the pandemic of developmental neurotoxicity, we propose a global prevention strategy. Untested chemicals should not be presumed to be safe to brain development, and chemicals in existing use and all new chemicals must therefore be tested for developmental neurotoxicity. To coordinate these efforts and to
